

# PHP DoS Project

16th October

# Current progress

1. Collect constraints across function invocation and solve constraints
2. Add dynamically running php built-in functions to assist solver
3. Around 600 sinks detected in taint analysis
4. Over 100 sinks exist satisfiable paths in our inaccurate solver

# Stuck at:

1. Translate PHP constraints to solver language
  - a. Some statements/expressions are not consistent
  - b. Built-in function cannot not be innovately/automatically modeled
